

VENKATESHWARA DOIJODE

Senior SDET | Automation Architect | AI-Augmented Quality Engineering
Chennai, Tamil Nadu, India | +91-9094117324 | venkateshdoijode1@gmail.com
linkedin.com/in/venkateshwara-doijode | github.com/VenkateshDoijode

PROFESSIONAL SUMMARY

Senior SDET & Automation Architect — 9+ years — Fintech & Banking QA. Cut regression cycles from 4 hrs to 45 min and release verification time by 60% building Java/Selenium/Playwright automation frameworks for Bank of New York. Individual contributor combining strong manual testing fundamentals and test design methodologies with UI + API test automation (REST Assured, Postman), root-cause defect analysis, CI/CD integration, and AI-augmented quality engineering for high-compliance financial systems.

CORE COMPETENCIES & TECHNICAL SKILLS

Languages: Java, Python, SQL, Shell/Bash

UI Automation: Selenium WebDriver, Playwright (Java & Python), Selenium Grid, Appium (Android/iOS)

API Testing: REST Assured, Postman, JSON/XML Validation, Contract Testing, Microservices Testing

Frameworks: TestNG, JUnit, Cucumber (BDD), Pytest, Page Object Model, Data-Driven & Keyword-Driven Testing

Manual Testing & Defect Analysis: Test Case & Test Design (Boundary Value, Equivalence Partitioning), Exploratory Testing, Root-Cause Defect Analysis, Test Management (JIRA)

AI/ML & Agents: AI-Assisted Test Generation, Predictive Test Selection, Anomaly Detection, Self-Healing Automation, AI Agent Development, MCP Servers, Agentic Automation Workflows

AI/ML & LLM Testing: Bias Testing, Drift Testing, Metamorphic Testing, Property-Based Testing

AI/ML Testing Tools: Deepchecks, Great Expectations, Giskard, Hypothesis, DeepEval, Evidently AI, Promptfoo, Ragas, MCP, HuggingFace

CI/CD & DevOps: Jenkins, Git, Docker, Kubernetes (AKS), Azure DevOps, GitHub Actions

Performance: JMeter, Gatling, k6

Databases: Oracle SQL Developer, PostgreSQL, PL/SQL, NoSQL (CouchDB), Backend Data Validation

Methodologies: Agile/Scrum, Shift-Left Testing, In-Sprint Automation, DevOps Quality Gates, TDD/BDD

Cloud: Azure (AKS Certified), AWS (Generative AI Essentials)

Tools: JIRA, ALM/QC, Git, Subversion, Containerized Test Environments

PROFESSIONAL EXPERIENCE

Senior SDET | Automation Architect (Individual Contributor) — Wipro Technologies

June 2021 – Present (4 Years 10 Months) | India — Bank of New York (BNY)

- Reduced manual regression effort by 70% as measured by cutting regression execution time from 4 hours to under 45 minutes, by designing and implementing a scalable, modular automation framework in Java, Selenium WebDriver, and TestNG with parallel test execution.
- Cut cross-browser test execution time by 35% as measured by faster smoke and regression cycles, by building a parallel Playwright automation suite in both Java and Python, supplementing Selenium for faster feedback on critical-path UI flows.
- Validated 100% of critical microservice endpoints pre-release as measured by zero P1 defects escaping to production over 8 consecutive releases, by building end-to-end API automation suites using REST Assured and Postman, covering OAuth authentication, HTTP headers, and complex JSON/XML payload validation.
- Reduced release verification time by 60% as measured by build-to-deploy cycle time, by architecting CI/CD-integrated automation pipelines in Jenkins with DevOps quality gates enforcing UI, API, and integration test pass rates before deployment.

- Maintained end-to-end quality ownership across 5+ Agile squads as measured by consistent stakeholder sign-off and on-time, defect-free releases over 8 consecutive quarters, by authoring BDD-style Cucumber feature files and collaborating directly with business analysts, developers, and cross-functional teams within Agile Scrum ceremonies to translate acceptance criteria into automated coverage.
- Reduced flaky test rate by 40% as measured by automation stability metrics tracked over two quarters, by implementing dynamic locators, smart waits, and AI-assisted anomaly detection to flag and correct unreliable tests.
- Caught edge-case defects before they reached automation coverage as measured by earlier detection in the test lifecycle, by applying manual testing fundamentals and test design methodologies — boundary value analysis, equivalence partitioning, and exploratory testing — to new features ahead of scripting automated checks.
- Cut average defect resolution time while ensuring data correctness as measured by zero data-integrity defects escaping validation and faster developer turnaround on reported issues, by writing SQL queries independently for root-cause defect analysis, correlating logs, API responses, and backend data to isolate failure patterns before handoff to developers.
- Champion QA process improvements as measured by adoption of new practices across the automation team, by researching and recommending modern automation strategies, including AI-assisted testing, and driving their rollout into the existing framework.
- Validated system behavior under load ahead of peak release windows as measured by early identification of performance bottlenecks, by designing and executing performance test scripts using JMeter and Gatling against critical transaction APIs.
- Improved release readiness visibility for stakeholders as measured by consistent sprint-level reporting adopted across the team, by managing test planning, execution tracking, and defect lifecycle in JIRA, aligning coverage against acceptance criteria each sprint.
- Cut manual data-lookup time for QA and dev teams significantly as measured by reduced ticket turnaround on data verification requests, by developing an internal AI agent giving on-demand access to transactional and hydration data.
- Reduced manual QA/UAT regression effort by 30–50% as measured by hours saved per release cycle, by building Python automation utilities for data parsing, report generation, and API validation.
- Accelerated automation adoption across the QA team as measured by faster onboarding time for junior engineers, by mentoring team members on Java automation, REST Assured, Playwright, and AI-augmented testing best practices — as an individual contributor working alongside, not managing, the team.

Programming Analyst — Cognizant Technology Solutions

May 2018 – May 2021 (3 Years 1 Month) | India — Blue Cross and Blue Shield of North Carolina

- Increased test coverage while reducing manual test design effort as measured by faster sprint-level test authoring, by implementing AI-assisted test generation techniques to automatically create and optimize test cases.
- Improved automation suite reliability as measured by reduced flaky-test rate across regression and integration suites, by applying AI-based test analysis tools for anomaly detection and continuous test result review.
- Reduced build validation time as measured by faster CI feedback loops, by building DevOps-driven automation workflows integrated into Jenkins/Git pipelines with parallel execution.
- Ensured reliable service-to-service validation as measured by consistent contract test pass rates across environments, by developing automation frameworks for microservices and API-driven architectures, including contract testing and system-level integration checks.
- Reduced defect leakage into later sprints as measured by earlier defect discovery rate, by applying shift-left testing practices, collaborating with developers during design and development to improve testability.

Associate Software QA Engineer — ReDIM Group

March 2017 – May 2018 (1 Year 3 Months) | Chennai, India

- Maintained full requirement traceability across releases as measured by zero untested requirement gaps at release sign-off, by designing comprehensive test plans, strategies, and cases and tracking requirement changes throughout the testing lifecycle.
- Validated end-to-end API contract adherence as measured by consistent JSON response accuracy across integration points, by executing REST API testing using REST Assured, integrated into CI/CD pipelines for continuous execution.
- Improved release readiness visibility as measured by real-time quality metrics tracked in QA dashboards, by managing defects in JIRA and ALM/QC and generating dashboards for stakeholders.

AI TESTING & QUALITY ENGINEERING — KEY ACHIEVEMENTS

- ↓ 70% manual AI response validation by automating LLM evaluation with Promptfoo and RAGAS.
- ↑ 60% AI evaluation coverage across positive, negative, edge-case, hallucination, and robustness scenarios.
- ↓ 65% AI regression evaluation time by integrating automated evaluations into CI/CD.
- Evaluated 1,000+ LLM responses/prompt variations for correctness, relevance, faithfulness, and consistency.
- ↓ 40% recurring AI-quality issues through automated prompt regression and evaluation gates.
- Automated 100+ AI-agent scenarios covering tool invocation, invalid inputs, failures, and multi-step workflows.

KEY CONTRIBUTIONS & INNOVATIONS

- Wipro Pragati Innovation Submission — Built a DAT file generation utility that eliminated manual test-data prep, formally recognized in Wipro's internal innovation program.
- Eliza AI Agent — Developed an internal AI agent giving on-demand access to transactional and hydration data, eliminating manual lookup bottlenecks for QA and dev teams.
- Custom MCP Server — Built a custom MCP server to automate Jira Zephyr Scale test case management, powered by a tiered AI engine (HuggingFace → Ollama → rule-based fallback).

EDUCATION

Bachelor of Engineering – Computer Science & Engineering (2011 – 2015)

Sree Sashta Institute of Engineering and Technology, Chennai

CERTIFICATIONS

- Azure Kubernetes Service (AKS) – Microsoft Azure
- Selenium with Java (Automation Testing) – Industry Certification
- Generative AI Essentials on AWS – Amazon Web Services
- NoSQL – CouchDB – Industry Certification
